They **do** tend to **howl** more as darkness is falling, or morning is coming. That might be why people think they're **howling at the moon**. They also tip their heads back, adding to that impression. **Dogs** still have some wolf behavior, so some **howl**.

Why Do Dogs Howl At The Moon? - Dogtime

<https://dogtime.com/dog-health/dog.../22207-why-do-dogs-howl-at-the-moon> ▾

Wolves are the ancestors of our indoor pups, and they're known for **howling at the moon**. ... Wolves are nocturnal, and they need to communicate, so they howl at night. They also throw their heads back,

Text Mining - Definition and Challenges

- Text mining
 - process of extracting interesting and non-trivial patterns or knowledge from unstructured text documents [Tan et al., 1999].
 - *a.k.a* text data mining [Hearst, 1997],
 - knowledge discovery from textual databases [Feldman and Dagan, 1995]
 - text analytics - application to solve business problems

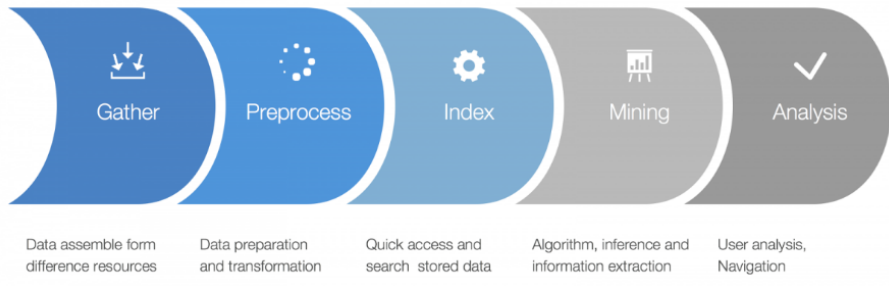

Text Mining - Definition and Challenges

- Text mining
 - process of extracting interesting and non-trivial patterns or knowledge from unstructured text documents [Tan et al., 1999].
 - *a.k.a* text data mining [Hearst, 1997],
 - knowledge discovery from textual databases [Feldman and Dagan, 1995]
 - text analytics - application to solve business problems
- Challenges
 - Unorganized form of data
 - semi-structured or unstructured
 - Deriving semantics from content
 - ambiguities at different levels - lexical, syntactic, semantic and pragmatic
 - Combining information from multi-lingual texts
 - Integrate domain knowledge

Steps in Text Mining

Text Mining

Text mining involves a series of activities to be performed in order to efficiently mine the information. These activities are:

source: <http://openminded.eu/text-mining-101/>

Text Mining - Preprocessing Steps

- Tokenisation
- Stemming
- Stopword Removal
- Sentence Segmentation

- Process of splitting text into words
- What is a word?
 - string of contiguous alphanumeric characters with space on either side; may include hyphens and apostrophes, but no other punctuation marks [Kučera and Francis, 1967].
- Useful clue - space or tab (English)

Tokenisation - Problems

- Periods
 - usually helps if we remove them
 - but useful to retain in certain cases such as \$22.50; Ed.,
- hyphenation
 - useful to retain in some cases e.g., state-of-the-art
 - better to remove in other cases e.g., gold-import ban, 50-year-old
- Single apostrophes
 - useful to remove them e.g., *is'nt*, *didn't*
- space may not be a useful clue all the time
- sometimes we want to use words separated by space as 'single' word
- For example:
 - San Francisco
 - University of Liverpool
 - Danushka Bollegala

Regular Expressions for Tokenisation

- Regular Expressions Cheatsheet

REGEX	NOTE	EXAMPLE	EXPLANATION

```

- Tokenisation turns out to be more difficult than one expects
- No single solution works well
- Decide what counts as a token depending on the application domain

- SPACY - a relatively new package for “Industrial strength NLP in Python”.
- Developed by Matt Honnibal at Explosion AI
- Designed with applied data scientist in mind
- SPACY supports:
 - Tokenisation
 - Lemmatisation
 - Part-of-speech tagging
 - Entity recognition
 - Dependency parsing
 - Sentence recognition
 - Word-to-vector transformations

SPACY - Feature Comparison

	SPACY	SYNTAXNET	NLTK	CORENLP

ZPar	1ms	8ms	850ms	5x	8x	44.7x
NLTK	4ms	443ms	<i>n/a</i>	20x	443x	<i>n/a</i>

source: <https://spacy.io/usage/facts-figures>

Tokenization in SPaCY

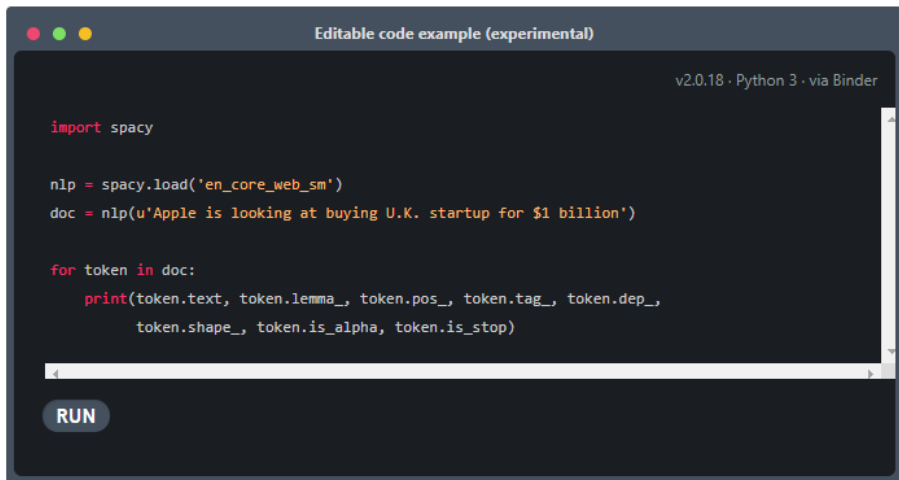

- Tokenizes text into words, punctuations and so on.
- Applies rules specific to each language
- Step 1: Split raw text based on whitespace characters (`text.split(' ')`)
- Step 2: Processes each substring from left to right and performs two checks:
 - Does the substring match a tokenizer exception rule
 - e.g., “don’t” ==> no whitespace ==> but split into two tokens “do” and “nt
 - “U.K.” ==> remain as one token

Tokenization in SPaCy

source: <https://spacy.io/usage/spacy-101>

Tokenization in SPaCY

The screenshot shows a Jupyter Notebook window titled "Editable code example (experimental)". The interface includes a top bar with three colored circles (red, green, yellow) on the left and the text "v2.0.18 · Python 3 · via Binder" on the right. The main area contains a code editor with the following Python code:

```
import spacy

nlp = spacy.load('en_core_web_sm')
doc = nlp(u'Apple is looking at buying U.K. startup for $1 billion')

for token in doc:
    print(token.text, token.lemma_, token.pos_, token.tag_, token.dep_,
          token.shape_, token.is_alpha, token.is_stop)
```

Below the code editor is a horizontal scrollbar and a button labeled "RUN".

source: <https://spacy.io/usage/spacy-101>

Tokenization in SPaCY

TEXT	LEMMA	POS	TAG	DEP	SHAPE	ALPHA	STOP
Apple	apple	PROPN	NNP	nsubj	Xxxxx	True	False

source: <https://spacy.io/usage/spacy-101>

- Removal of inflectional ending from words (strip off any affixes)
 - connections, connecting, connect, connected → connect
- Problems
 - Can conflate semantically different words
 - *Gallery* and *gall* may both be stemmed to *gall*
- Lemmatization: a further step to ensure that the resulting form is a word present in a dictionary

Regular Expressions for Stemming

```
1 import re
2 print re.findall(r'^(.*)(ing|ly|ed|ions|ies|ive|es|s|ment)$', 'processing')
3 [('process', 'ing')]
4
5 import re
6 print re.findall(r'^(.*)(ing|ly|ed|ions|ies|ive|es|s|ment)$', 'processes')
7 [('processe', 's')]
8
```

- note that the star operator is “greedy”
- the .* part of expression tries to consume as much as the input as possible
- for non-greedy version of the star operator = *?

```
9 import re
10 print re.findall(r'^(.?*)(ing|ly|ed|ions|ies|ive|es|s|ment)$', 'processes')
11 [('process', 'es')]
12
13
```

Regular Expressions for Stemming

```
78 import nltk, re
79
80 def stem(word):
81     regexp = r'^(.?.*)(ing|ly|ed|ions|ies|ive|es|s|ment)?$'
82     stem, suffix = re.findall(regexp, word)[0]
83     return stem
84
85 raw = """DENNIS: Listen, strange women lying in ponds distributing swords
86         is no basis for a system of government. Supreme executive power derives from
87         a mandate from the masses, not from some farcical aquatic ceremeony."""
88
89 tokens = nltk.word_tokenize(raw)
90 print [stem(t) for t in tokens]
91
92 ['DENNIS', ':', 'Listen', ',', 'strange', 'women', 'ly', 'in', 'pond', 'distribut', 'sword',
93  'i', 'no', 'basi', 'for', 'a', 'system', 'of', 'govern', '.', 'Supreme', 'execut', 'power',
94  'deriv', 'from', 'a', 'mandate', 'from', 'the', 'mass', ',', 'not', 'from', 'some',
95  'farcical', 'aquatic', 'ceremeony', '.']
96
97
```

Regular Expressions for Stemming

```
78 import nltk, re
79
80 def stem(word):
81     regexp = r'^(.*?)(ing|ly|ed|ions|ies|ive|es|s|ment)?$'
82     stem, suffix = re.findall(regexp, word)[0]
83     return stem
84
85 raw = """DENNIS: Listen, strange women lying in ponds distributing swords
86         is no basis for a system of government. Supreme executive power derives from
87         a mandate from the masses, not from some farcical aquatic ceremeony."""
88
89 tokens = nltk.word_tokenize(raw)
90 print [stem(t) for t in tokens]
91
92 ['DENNIS', ':', 'Listen', ',', 'strange', 'women', 'ly', 'in', 'pond', 'distribut', 'sword',
93  'i', 'no', 'basi', 'for', 'a', 'system', 'of', 'govern', '.', 'Supreme', 'execut', 'power',
94  'deriv', 'from', 'a', 'mandate', 'from', 'the', 'mass', ',', 'not', 'from', 'some',
95  'farcical', 'aquatic', 'ceremeony', '.']
96
97
```

● Problems

- RE removes 's' from 'ponds', but also from 'is' and 'basis'
- produces some non-words like 'distribut', 'deriv'

NLTK Stemmers

- NLTK provides several off-the-shelf stemmers
- Porter and Lancaster stemmers have their own rules for stripping affixes

```
1 import nltk, re
2
3 raw = """DENNIS: Listen, strange women lying in ponds distributing swords
4         is no basis for a system of government. Supreme executive power derives from
5         a mandate from the masses, not from some farcical aquatic ceremeony."""
6
7 porter = nltk.PorterStemmer()
8 lancaster = nltk.LancasterStemmer()
9 tokens = nltk.word_tokenize(raw)
10
11 print [porter.stem(t) for t in tokens]
12 [u'denni', ':', 'listen', ',', u'strang', 'women', u'lie', 'in', u'pond', u'distribut',
13  u'sword', 'is', 'no', u'basi', 'for', 'a', 'system', 'of', u'govern', '.', u'suprem',
14  u'execut', 'power', u'deriv', 'from', 'a', u'mandat', 'from', 'the', u'mass', ',', 'not',
15  'from', 'some', u'farcic', u'aquat', u'ceremeoni', '.']
16
17 print [lancaster.stem(t) for t in tokens]
18 ['den', ':', 'list', ',', 'strange', 'wom', 'lying', 'in', 'pond', 'distribut', 'sword',
19 'is', 'no', 'bas', 'for', 'a', 'system', 'of', 'govern', '.', 'suprem', 'execut', 'pow',
20 'der', 'from', 'a', 'mand', 'from', 'the', 'mass', ',', 'not', 'from', 'som', 'farc',
21 'aqu', 'ceremeony', '.']
```

Is stemming useful?

- Provides some improvement for IR performance (especially for smaller documents).
- Very useful for some queries, but on an average does not help much.
- Since improvement is very minimal, often IR engines does not use stemming.

Stopword Removal

- Removal of high frequency words
- Most common words such as articles, prepositions, and pronouns etc. does not help in identifying meaning

a	an	and	are	as	at	be	by	for	from
has	he	in	is	it	its	of	on	that	the
to	was	were	will	with					

Figure: A stop list of 25 semantically non-selective words which are common in Reuters-RCV1

Methods for stopword removal

- Classic Method
 - removing stop-words using pre-compiled lists
- Zipf's law (Z-methods)
 - frequency of a word is inversely proportional to its rank in the frequency table
 - remove most frequent words
- Mutual Information Method
 - supervised method that computes mutual information between a given term and a document class
 - low mutual information suggests low discrimination power of the term and hence should be removed

Sentence Segmentation

- Divide text into sentences
- Involves identifying **sentence boundaries** between words in different sentences
- *a.k.a* sentence boundary detection, sentence boundary disambiguation, sentence boundary recognition
- Useful and necessary for various NLP tasks such as
 - sentiment analysis
 - relation extraction
 - question answering systems
 - knowledge extraction

Sentence boundary detection algorithms

- Heuristic methods
- Statistical classification trees [Riley, 1989]
 - probability of a word occurring before or after a boundary, case and length of words
- Neural Networks [Palmer and Hearst, 1997]
 - POS distribution of preceding and following words
- Maximum entropy model [Mikheev 1998]

Sentence Segmentation - Using SPaCy

The screenshot shows a Jupyter Notebook window titled "Editable code example (experimental)". The top right corner indicates the environment is "v2.0.18 · Python 3 · via Binder". The code cell contains the following Python code:

```
import spacy

nlp = spacy.load('en_core_web_sm')
doc = nlp(u"This is a sentence. This is another sentence.")
for sent in doc.sents:
    print(sent.text)
```

Below the code cell is a "RUN" button. The output cell shows the results of the code execution:

```
This is a sentence.
This is another sentence.
```

Sentence Segmentation - Using SPaCy

Editable code example (experimental) v2.0.18 · Python 3 · via Binder

```
import spacy

text = u"this is a sentence...hello...and another sentence."

nlp = spacy.load('en_core_web_sm')
doc = nlp(text)
print('Before:', [sent.text for sent in doc.sents])

def set_custom_boundaries(doc):
    for token in doc[:-1]:
        if token.text == '...':
            doc[token.i+1].is_sent_start = True
    return doc

nlp.add_pipe(set_custom_boundaries, before='parser')
doc = nlp(text)
print('After:', [sent.text for sent in doc.sents])
```

RUN

Before: ['this is a sentence...', 'hello...and another sentence.']
After: ['this is a sentence...', 'hello...', 'and another sentence.']

Part-of-Speech Tagging (POS)

- Task of tagging POS tags (Nouns, Verbs, Adjectives, Adverbs, ...) for words
- POS tags provide lot of information about a word
 - knowing whether a word is **noun** or **verb** gives information about neighbouring words
 - nouns are preceded by determiners; adjectives and verbs by nouns
 - useful for Named entity recognition; Machine Translation; Parsing; Word sense disambiguation
- Given a word, we assume it can belong to only of the POS tags.
- POS Tagging problem
 - Given a sentence $S = w_1 w_2 \dots w_n$ consisting of n words, determine the corresponding tag sequence $P = P_1 P_2 \dots P_n$

- Words often have more than one POS: e.g., back
 - *The back door* = adjective (JJ)
 - *On my back* = noun (NN)
 - *Win the voters back* = adverb (RB)
 - *Promised to back the bill* = verb (VB)

POS Tagging - Tagset

Tag	Description	Example	Tag	Description	Example
CC	coordin. conjunction	<i>and, but, or</i>	SYM	symbol	<i>+, %, &</i>
CD	cardinal number	<i>one, two</i>	TO	"to"	<i>to</i>

RB	adverb	<i>quickly, never</i>	,	comma	<i>,</i>
RBR	adverb, comparative	<i>faster</i>	.	sentence-final punc	<i>! ?</i>
RBS	adverb, superlative	<i>fastest</i>	:	mid-sentence punc	<i>: ; ... --</i>
RP	particle	<i>up, off</i>			

Figure: Penn Treebank POS Tags

- **Brown Corpus** - standard corpus used for POS tagging task
- first text corpus of American English
- published in 1963-1964 by Francis and Kucera
- consists of 1 million words (500 samples of 2000+ words each)
- Brown corpus is PoS tagged with Penn TreeBank tagset.
- $\approx 11\%$ of the word types are ambiguous with regard to POS
- $\approx 40\%$ of the word tokens are ambiguous
- ambiguity for common words. e.g. **that**
 - I know **that** he is honest = preposition (IN)
 - Yes, **that** play was nice = determiner (DT)
 - You can't to **that** far = adverb (RB)

Automatic POS Tagging

- Symbolic
 - Rule-based
 - Transformation-based
- Probabilistic
 - Hidden Markov Models
 - Maximum Entropy Markov Models
 - Conditional Random Fields

- An example of Transformation-Based Learning
 - Basic idea: do a quick job first (using frequency), then revise it using contextual rules.
 - Painting metaphor from the readings
- Very popular (freely available, works fairly well)
- A supervised method: requires a tagged corpus

- Start with simple (less accurate) rules...learn better ones from tagged corpus
 - Tag each word initially with most likely POS
 - Examine set of **transformations** to see which improves tagging decisions compared to tagged corpus
 - Re-tag corpus using best transformation
 - Repeat until, e.g., performance doesn't improve
 - Result: tagging procedure (ordered list of transformations) which can be applied to new, untagged text

Automatic POS Tagging: Brill Tagger - Example

- Examples:
 - They are expected to **race** tomorrow.
 - The **race** for outer space.
- Tagging algorithm:
 1. Tag all uses of “race” as NN (most likely tag in the Brown corpus)
 - They are expected to **race/NN** tomorrow
 - the **race/NN** for outer space
 2. Use a transformation rule to replace the tag NN with VB for all uses of “race” preceded by the tag TO:
 - They are expected to **race/VB** tomorrow
 - the **race/NN** for outer space

Automatic POS Tagging: Brill Tagger - Sample Final Rules

Rules:

```
NN -> NNP if the tag of words i+1...i+2 is 'NNP'
NN -> VB if the tag of the preceding word is 'TO'
NN -> VBD if the tag of the following word is 'DT'
NN -> VBD if the tag of the preceding word is 'NNS'
NN -> JJ if the tag of the preceding word is 'DT', and the tag of the following word is 'NN'
NN -> NNP if the tag of the preceding word is 'NN', and the tag of the following word is ','
NN -> NNP if the tag of words i+1...i+2 is 'NNP'
NN -> IN if the tag of the preceding word is '.'
NNP -> NN if the tag of words i-3...i-1 is 'JJ'
NN -> JJ if the tag of the following word is 'JJ'
NN -> VBP if the tag of the preceding word is 'PRP'
WDT -> IN if the tag of the following word is 'DT'
NN -> JJ if the tag of the preceding word is 'IN', and the tag of the following word is 'NN'
NN -> VBN if the tag of the preceding word is 'VBP'
VBD -> VB if the tag of the preceding word is 'MD'
NN -> JJ if the tag of the preceding word is 'CC', and the tag of the following word is 'NN'
```
